To add more clarification on how to setup PyCharm with pipenv for now:

1. Execute in your project directory

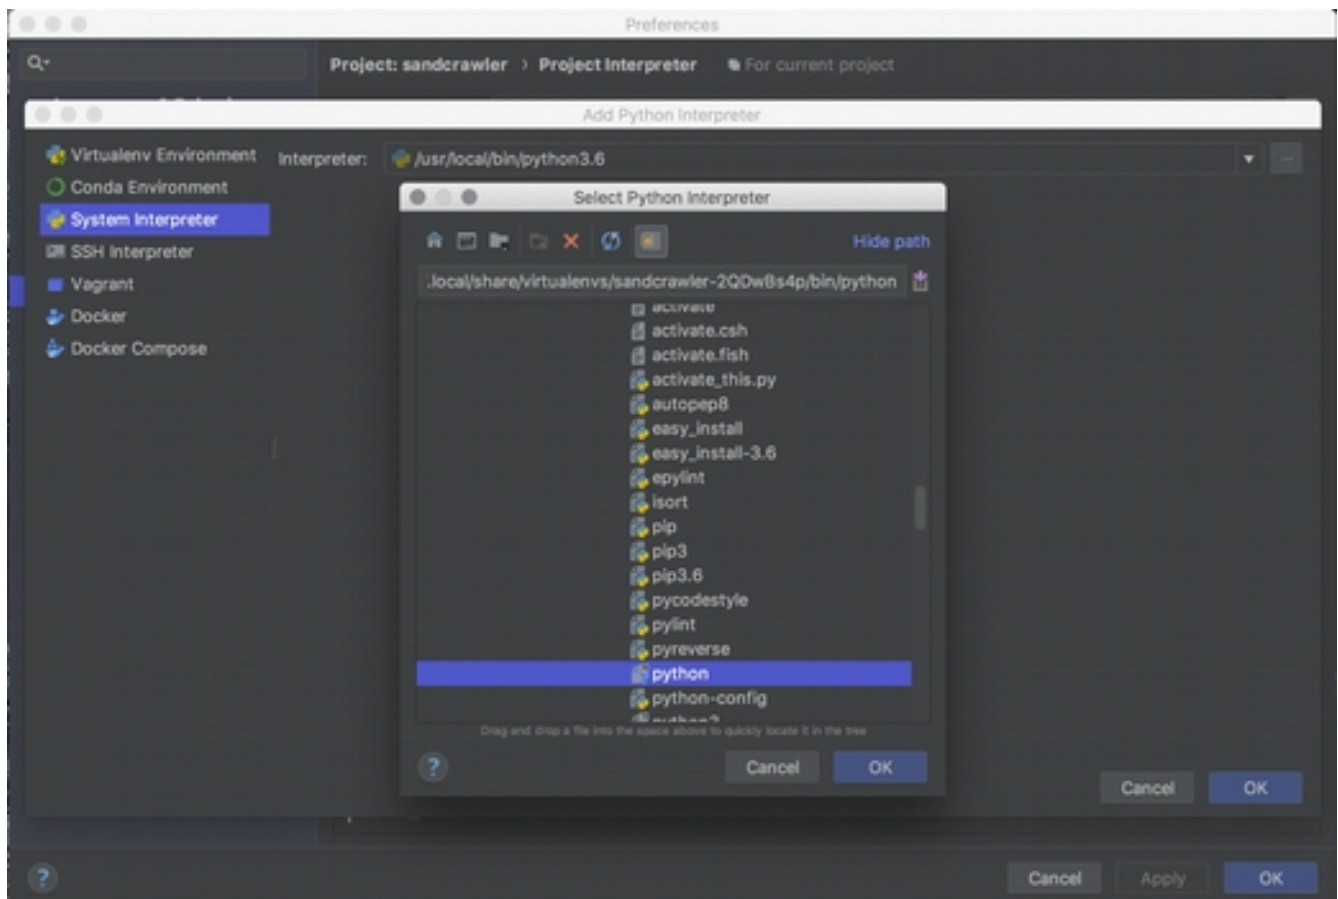

```
pipenv --venv
```

Save the output, you'll reference this path later

2. In PyCharm, Open Project Settings, and then select project interpreter

3. Click Add a Python Interpreter > System Interpreter > Select Python Interpreter and paste the output from the first command, appending /bin/python onto the end.

Note that you will need to use the command line to install any packages since PyCharm currently doesn't support pipenv in their package management tools. However, I haven't had a problem with this method.
